

DEFT Recommendation on the Hood Diversion

- DEFT believes that a Hood/Mokelumne diversion poses substantial risk of adverse impacts to fish, especially to upstream migrants, and that it should not be built unless the ability to offset these impacts is proven.

Impact Areas

- Downstream Migrants
 - Diversion effects
 - Effects of downstream flow reduction
- Upstream Migrants
 - Straying
 - Passage

Benefit Areas

- Testing of screens, bypasses
- Testing of upstream passage
- Flexibility of operation with DCC
